CoE-LaSR Vision

- “**Laser scanning is omnipresent and affecting positively the life of every citizen in modern information society by early 2020s**”
- In the next two decades, new mobile laser scanning systems are making laser scanning more ubiquitous in the same sense as the first personal computing was followed by ubiquitous computing. Even autonomous robots using point-cloud-generating perception sensors may be added to the ecosystem during this timeframe. **What can be said for certain is that during the 2020s and 2030s, there will be a great number of laser scanners omnipresent in everyday life. Mobile Laser Scanning is also one of the main techniques to create local virtual reality**.
- **We are in the middle of disruptive technologies, multidisciplinary work**

Industry revolution

- You are in a middle of the disruptive technologies
- **NMCAs (National Mapping and Cadastre Agencies) shoud stimulate the process, but can hardly adapt to situation**
- Mapping is done by major global ICT companies
- Tiny SMEs have technically the same capacity as NMCAs, but are more innovative
- Nokia acquired Navteq with 8B$ in 2007: Similar technology is in 2030 in 15% of all new cars (15-20M units)
- Intel acquired Mobileye for 15.3 B€ (turnover 71M$)

Industry will solve real-time, fully automated mapping in these conditions, how about you ?

Autonomous driving

Autonomous Driving

Google's modified Toyota Prius uses an array of sensors to navigate public roads without a human driver. Other components, not shown, include a GPS receiver and an inertial motion sensor.

LIDAR
A rotating sensor on the roof scans more than 200 feet in all directions to generate a precise three-dimensional map of the car's surroundings.

POSITION ESTIMATOR
A sensor mounted on the left rear wheel measures small movements made by the car and helps to accurately locate its position on the map.

VIDEO CAMERA
A camera mounted near the rear-view mirror detects traffic lights and helps the car's onboard computers recognize moving obstacles like pedestrians and bicyclists.

RADAR
Four standard automotive radar sensors, three in front and one in the rear, help determine the positions of distant objects.

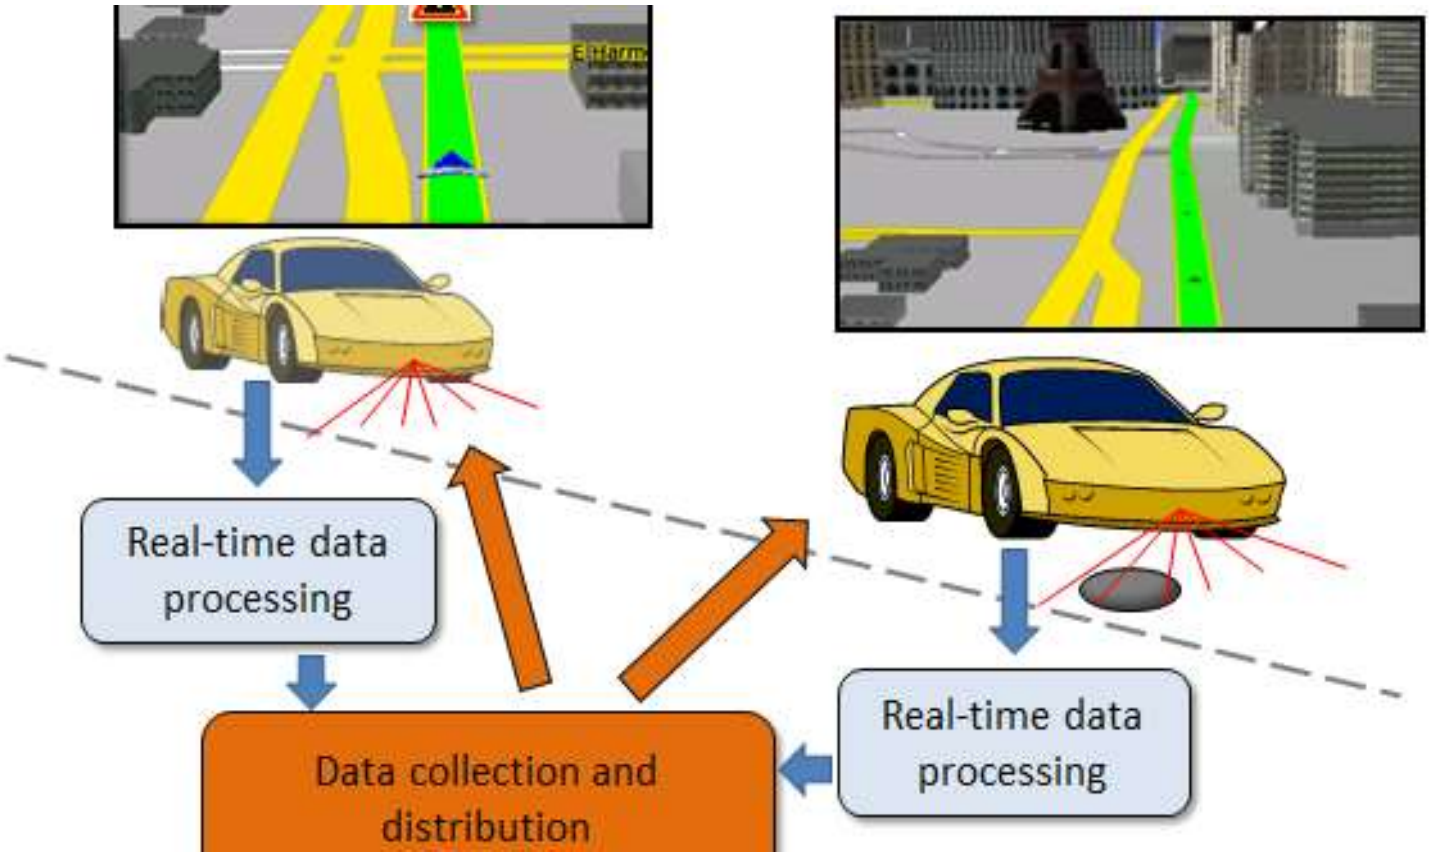
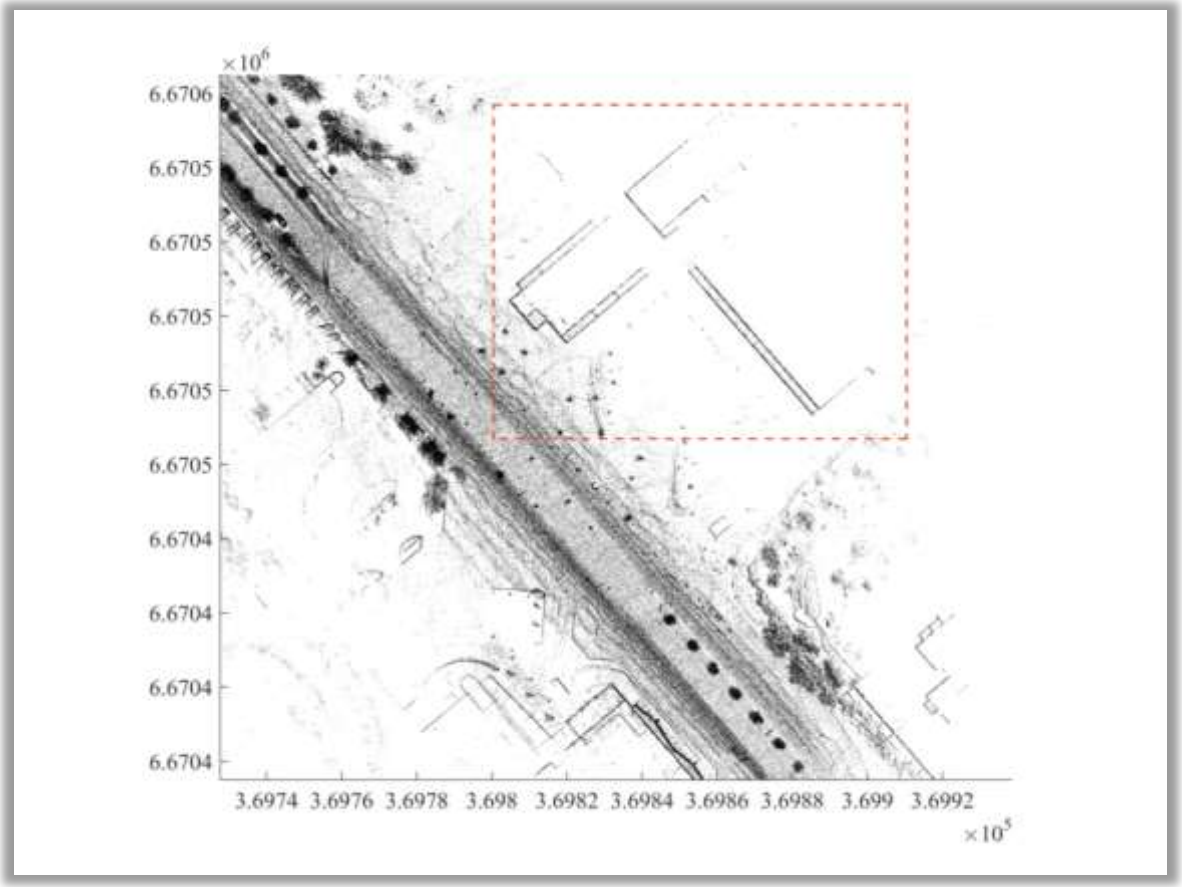
Data used as Big Data?

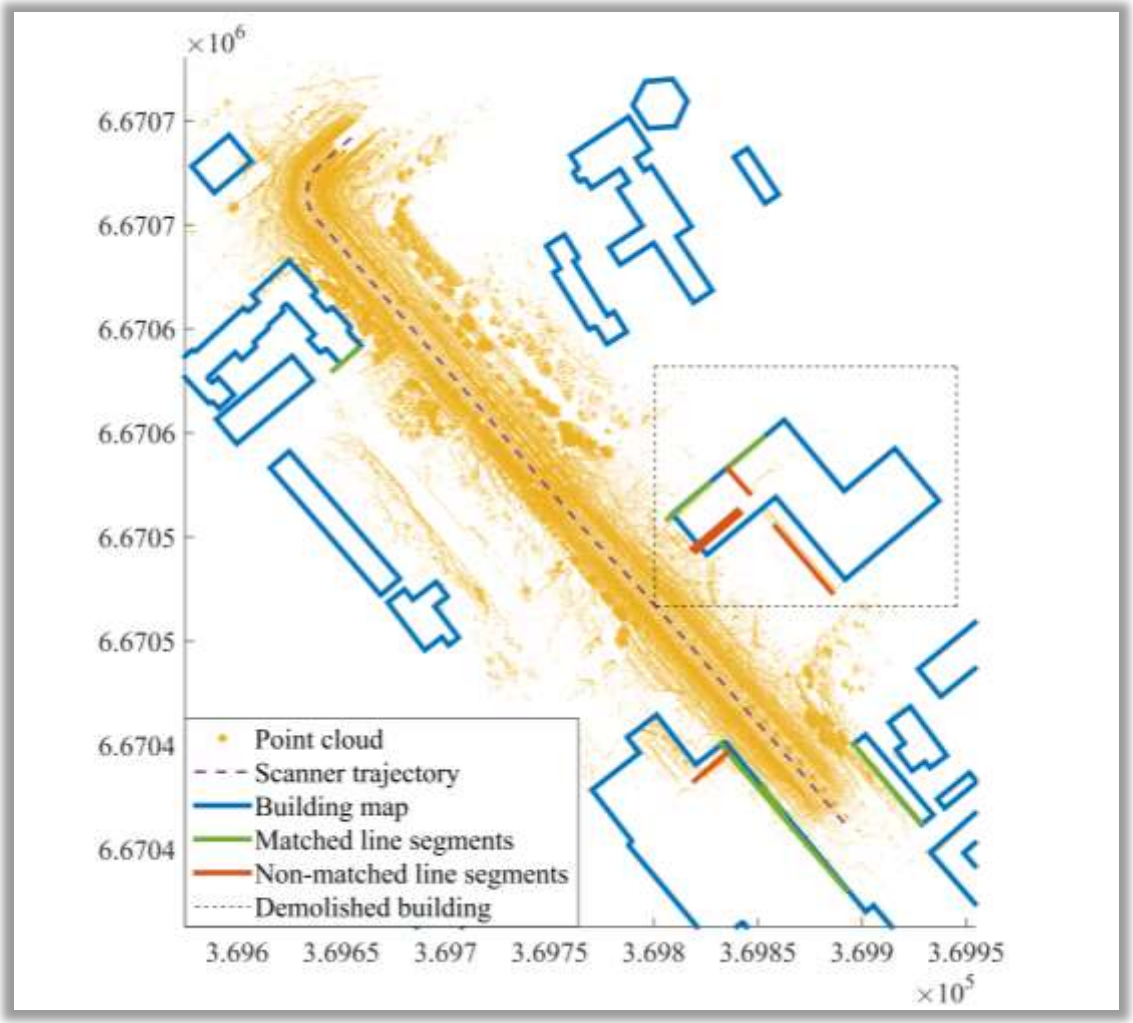


NLS FINNISH GEOSPATIAL RESEARCH INSTITUTE FGI



Automated map updating

The area inside the rectangle (red dashed line) contains the new buildings that were not presented in the old building map.



Old Building Map and Extracted Lines

The extracted lines (red and green) have been compared with the old building map (blue lines). Red lines correspond to extracted walls that do not match with the old building map: They indicate new buildings.

Car parkings

Figure. a) Part of the street Espoonlahdenkatu as recorded on the reference video during data acquisition Drive 1. b) Raster representation of the car-based laser scanner data. The pixel value of each 0.3 m × 0.3 m cell corresponds to the number of laser points inside the cell. Parked cars appear as L shaped clusters of bright pixels.

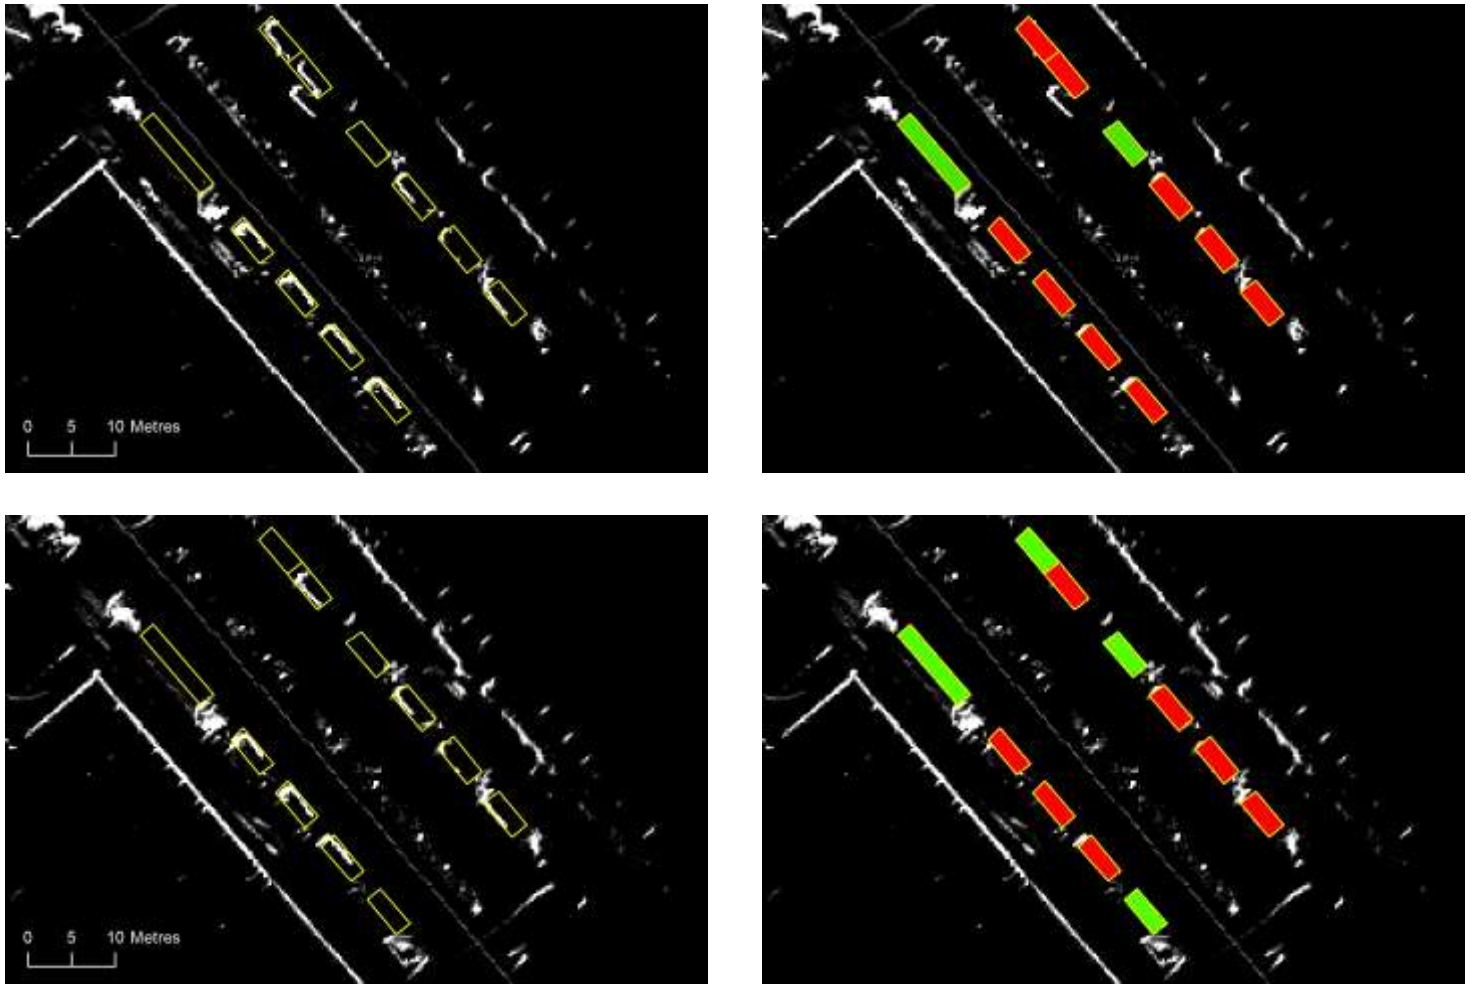


Figure x. Data (left) and classification results (right) for Drives 1 (upper row) and 2 (lower row). Parking places classified as free are shown in green and parking places classified as occupied are shown in red. Digitized boundaries of the parking places are shown in yellow.

What should NMCA do?

NLS
FINNISH GEOSPATIAL
RESEARCH INSTITUTE
FGI

Action items

- Main issue from collaboration with companies
  - **Reasonable amount of current money allocated smartly to R&D of innovative SMEs capable to export will pay it back to the society with increased employment and taxes paid**. With the current technology disruption this may even generate a new value adding service sector.
- National collaboration at ministry level may be needed
  - **National data acquisition programmes solving national problems** (environment, built, traffic etc)
- Provide National Core Datasets
  - **Industry provides as subcontract, NMCA specifies**
  - Huge savings when large areas collected at the same time
  - **Open data or near-open data** serving all citizens and Value-adding companies
- What about if National Topographic database = High-quality Point Cloud + Images (and basic products done with 95% automation)

CHANGE
OR DIE.
